PROFILE

Game programmer and technical designer with a software engineering background, currently completing an MSc in Computer Games at Queen Mary University of London. Solo-designed and built Yassantra, a horror game centered on a custom-built enemy AI covering the full finite-state-machine architecture and sensor systems, as well as level layout, encounter pacing and environmental storytelling. Comfortable owning both sides of a feature: the systems that make an AI or mechanic work and the design decisions that make it worth building. Also led environment design, enemy balancing and narrative direction on FeatherBound, a university team project and completed a professional internship at Elyndor Interactive owning AI and level implementation on an unreleased title.

PROFESSIONAL EXPERIENCE

Programming Intern, Elyndor Interactive

December 2025 –
June 2026
Remote

- Owned full implementation of a starting game level for *Kaali: A Mother's Tale* (unreleased horror title)
- Took ownership of the enemy AI system in the final phase – designed and implemented detection systems (vision sensors, configurable range) from a high-level behavioral brief
- Identified workflow issues mid-internship and restructured team process
- Assumed informal assistant-lead responsibilities on design decisions, scope and timeline at an early-stage startup

PROJECTS

Yassantra, 3D Horror Game

July 2026

- Designed and implemented a 6-state enemy AI (Patrol, Alert, Chase, Attack, Search, custom Investigate) on Unity NavMesh
- Rebuilt the hearing sensor from a hard-capped model into a fully sphere-based, uncapped detection system
- Built a unified event-driven sound propagation system driving both atmosphere and AI reactions across 7+ sound sources
- Implemented trap/hazard systems with a global session-wide cap, dual-zone colliders and tiered proximity damage
- Designed a 3-gate escape sequence with AI rerouting logic and a genuine fail-state path

FeatherBound, 3D Survival Adventure Game

October 2025 –
January 2026

- Designed and built 4 biome environments with escalating enemy difficulty scaling
- Designed and implemented enemy behaviour and balancing values across all biomes; owned narrative direction and lore

Galaxy Shooter, 2D Arcade Shooter Game

January 2026

- Extended a tutorial framework with an original difficulty-scaling system (continuous enemy acceleration to 3x speed over 200s)
- Implemented power-up, life and local high-score systems

AirVOID V-1.2, 2D Endless Arcade Game

September 2024

- Built core game loop (input, collision, spawning, scoring, state management) from a tutorial base with custom additions

SKILLS AND TECHNOLOGIES

Programming – C, C++, C#, Java, Python, PHP, JavaScript, SQL

Engines and Systems – Unity (2019–6.3 LTS), NavMesh AI, finite state machines, sensor-based detection (vision/hearing), event-driven sound propagation

Tools – Tools: Git/GitHub, Visual Studio, Figma, Canva
